

(a) A4 — adversary makes no attempt to evade

caught only while a transient rule happens to fire

unknown device key (0.35)

session continuity < 0.50 (0.20)

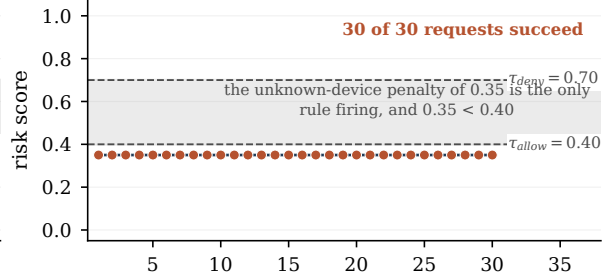

call rate > 30/min (0.25)

geo velocity > 500 km/h (0.60)

request index within the attack (30 attempts)

(b) A7 — same takeover, adversary paces and mimics

the unforgeable signal is left alone, and it is inert

request index within the attack (30 attempts)

Both flanking signals in (a) are artefacts of window bookkeeping rather than properties of the adversary: session continuity stops firing once the adversary's own traffic has diluted the victim's baseline past 0.50, and call rate starts firing only once the shared 60 s window has accumulated more than 30 events. (b) removes both.
